Compat Trigger

Triggers compat mode
for the individual's
browser

And **if they opted in** to
provide usage stats, the
browser informs
Microsoft

Compat Trigger

Compat Trigger

It works in the other
direction as well

Other Triggers

1. The user has opted to “Display all websites in Compatibility View”
2. The user has opted to “Display all intranet sites in Compatibility View” and the site in question is on an intranet*
3. The user has opted to “Automatically recover from page layout errors with Compatibility View” and the page in question causes an error that triggers this fallback

*excluding localhost and 127.0.0.1

Does Microsoft want
to have their cake
and eat it to?

How I see it

If you want...

word-spacing in ems ... to bid farewell to hasLayout ...
object to work like it should ... display: run-in; ...
border-collapse and border-spacing ... inherit to
work properly ... white-space: pre-wrap; ... legend to
be stylable and wrappable ... generated content ... :lang()
selectors ... attr() in generated content ... CSS
counters ... support for quotes ... page break control in CSS
for print ... outline control ... support for data: URIs ...
cross-domain requests ...
el.getAttributeNode('style') ...
el.setAttribute('style', 'color: #f00;') ...
document.getElementsByName('foo') ...

... you'll need to be in
IE8 Standards Mode
